FARM EMPLOYMENT LITTLE CHANGED FROM LAST YEAR

The number of persons working on farms the first of November is estimated at 10,690,000 or practically the same as on the same date last year, the U. S. Department of Agriculture reported today. This represents a decline of about 1,150,000 workers from October 1 -- somewhat less than the usual decrease during this period. In most agricultural areas, weather conditions at the turn of the month were nearly ideal for harvest of crops. This, together with the lateness of the cotton harvest, probably accounts for the less than usual decline in agricultural employment during October. Total farm employment in the U. S. on November 1 was about six percent less than the average for that date during the 1935-39 period.

While the number of unpaid family workers, including farm operators, increased from 8,064,000 on November 1 last year to 8,168,000 on the first of this month, the number of hired workers declined from 2,634,000 to 2,522,000, a drop of about four percent between the two dates. Unpaid family workers thus represented 76.4 percent of total farm employment. This is the largest percentage of record for that month except for 1934, in which year severe drought conditions curtailed crop production and reduced the need for hired labor. The greater reliance on family workers this season is due primarily to high wage rates and the difficulty in obtaining hired workers, especially of the type that farmers consider competent. In many communities, greater than usual use of school children during the fall harvest has also tended to increase the number of family members doing farm work this year. The employment of family workers was not uniform over the entire country; decreases in fact were recorded for New England, Middle Atlantic, and Mountain Regions.

The number of hired workers decreased in all of the geographic regions except the West South Central and Mountain Regions where gains were shown. Elsewhere declines ranging from 16 percent in New England to 2 percent in the Middle Atlantic Region were indicated. The substantial reduction in number of hired workers in New England compared with a year ago is due largely to the early completion of the harvest this year.

This season's farm labor force has had a larger than usual number of workers obtained from sources not normally drawn upon. In addition to increased employment of farm women and children, large numbers of townspeople have aided with the work

on farms. Foreign workers brought in from Mexico, the Bahamas, Jamaica, Barbados, and Newfoundland have been and are at present working on farms throughout the country. The contribution of foreign workers to the production and harvest of crops has been much greater than their numbers might indicate. While they represent only a small percentage of the total farm labor force, they are, for the most part, able-bodied men, capable of doing hard work for long hours at a stretch, and they can be shifted from one job or area to another with a minimum of lost time. As of October 31, the number of foreign workers employed in or available for agricultural work included 52,646 Mexican Nationals, 14,305 Jamaicans, 756 Barbadians, 5,129 Bahamians, and 1,012 Newfoundlanders.

The Provost Marshal General's office of the War Department reports that war prisoners put in 1,375,328 man days of labor in agriculture during the month of October. This is comparable to 52,897 men working full time for 26 days. It should be noted that this report is for man days worked and does not represent the number of prisoners in camps. Further, it does not reflect the time they were available for work but were not able to do so because of bad weather, etc. Corresponding figures for the previous month (September) are 746,452 man days of labor or the equivalent of 28,713 men working full time. The work output of these men, most of whom are Germans, is not, of course, equal to that of free labor in normal times. Nevertheless, their contribution has helped materially in the production and harvest of crops in many areas. Their participation covers a wide range of farm jobs including picking cotton, stacking peanuts, snapping and picking corn, cutting sugar cane, and picking fruit. Where war prisoners are used, the farmer pays the Government the prevailing rate in the community for the particular type of work involved and also hauls the prisoners to and from the camp each day. The Government feeds the prisoners, including their lunch, and, of course, provides a guard.

Cotton Picking Rates - Up to November 1, the average rate paid for picking seed cotton was \$1.92 per hundred pounds or about 16 percent higher than the rate of \$1.66 at this time last season. The gains over a year ago were not uniform over the Cotton Belt. In general, increases of about 15 percent were shown for the States of South Carolina, Georgia, Alabama, Texas, and Arizona. In the Mississippi Delta and in North Carolina and Florida, rates were up about 20 percent from last year. Elsewhere increases averaged about 8 percent over last season. Wage ceilings have been placed on the rates for picking cotton in specific areas in California and Arizona. Maximum wage rates for picking and snapping American Upland cotton in California are \$2.25 for picking and \$1.50 for snapping a hundred pounds of seed cotton. In Arizona, the ceiling rate is \$2.25 in some counties and \$2.00 in certain others for picking Upland cotton and \$4.00 for picking American Egyptian cotton.
